

Supplementary Figures

Figure Legend

Figure S1. Determination of drug concentration in wound width. Cells were seeded at a density of 12,000 cells/well in 96-well plates. Then cells were treated with KPT-335 from 0.3125 to 5 μ M for 24 h and cell viability was performed by CCK-8 assay in KYSE30 and KYSE450. The data were analyzed by Student's t-test (two-sided) or one-way ANOVA. Error bars represent \pm s.d., * $P < 0.05$, ** $P < 0.01$.
